On March 29, Alex Merritt was signed in to the Zoom video conferencing app, discussing a biblical passage with members of his Sunday school young adults group at St. David's Episcopal Church in Austin, Texas.

Then the trolls attacked.

Some began sharing their screens and drawing obscene images over the text the group had been discussing. "You are being hacked! You are being hacked!" one shouted. Another turned on his video and began revealing his genitals.

"It was generally chaotic and impossible to stop," recalled Merritt. "It was a huge wake-up call for me because I'm an elementary public school teacher, and I don't want the children in my class exposed to any of the pornographic images that trolls sent us."

The mass transition of houses of worship to Zoom and other online video conferencing platforms has meant that religious services are more accessible than ever before.

Unfortunately for digital congregants, that means they are also more accessible to online trolls who have plenty of free time to disrupt their services with obscene or hateful interruptions.

Merritt's church group, which had to shut down its meeting and set up a new one, originally put a public Zoom link on its website. Now, the group will only send the link to members of its private Facebook groups, all of whom have been approved.

"I think places of worship need to be really careful when they put public Zoom links on their websites, especially if those links are to meeting spaces where there will be young children," Merritt told Religion News Service. "Places of worship, ideally, want to be places that anyone can attend. At the moment, they need to balance this desire to be open to all who seek and the reality that there are folks out there who would sabotage these digital spaces."

The epidemic of "[Zoombombing](#)" has spared no one, with trolls finding meeting links that have been posted online, then sharing and drawing graphic content on participants' screens — leaving schools and universities, churches and synagogues alike with no choice but to close their meetings abruptly.

A Shabbat service held via Zoom by a Bay Area synagogue was [crashed](#) by Nazis. A Unitarian Universalist church in Massachusetts saw a livestreamed service on YouTube [deluged](#) with dislikes. A livestreamed church service in Los Angeles was hacked and [replaced](#) with porn. A Zoom webinar last week with the People's Forum, an activist-oriented cultural space directed by theologian Claudia de la Cruz, was disrupted by a troll posting the n-word in the chat window repeatedly until administrators blocked him.

"My heart sank when I saw it happen," said the Rev. Jason Wells, who had joined the People's Forum event from Concord, New Hampshire, and saw the racist messages. "There are lots of great justice workers on that call and I felt deflated when I thought of how it would affect everyone there."

On March 29 morning in Boston, the Rev. Laura Everett was on Zoom at Boston's First Baptist Church in Jamaica Plain preaching about death when users from outside the church's congregation hijacked the service.

After finding a link to the service, which Everett had tweeted so her followers could tune in to her sermon, the trolls began forcing racist and anti-LGBT hate speech onto participants' screens.

The disruption, which forced church leaders to stop the meeting and reconvened in a password-protected web conference when simply muting and removing the trolls did not work, left Everett thinking about "how " for the congregation in that moment.

Combined with the desire to leave their churches' doors open to the masses, many religious leaders' newness with the technology means they struggle to protect their services from such disruptions.

Many faith-based organizations, including the [United Methodist Church of New England](#) and the [Southern New England Conference of the United Church of Christ](#), have begun sharing tips with members for avoiding Zoombombing. Zoom's own blog has published an extensive [guide](#) to the features that hosts can use to protect their meetings.

"If you don't advertise how to get onto the meeting it becomes much harder for people to join the meeting in the first place," wrote David Sim, a trainee minister with the Church of Scotland who created a [guide](#) to preventing Zoombombing. "That

may be counter-intuitive where we want to welcome all, so it may not be possible in every case – for example for our public worship where we want everyone to join. However, if you are having a business meeting, a Messy Church or a small prayer meeting, you can share joining details by email or text on a need to know basis."

Merritt, who began researching ways to protect his students as he moved to distance learning, recommended that administrators disable screen sharing and annotations during meetings. Otherwise, any participant who joins the meeting can share the contents of their own screen or draw anything onto the shared screen.

He also urged houses of worship to enable Zoom's waiting room feature so the host can approve folks to join the meeting and be ready to boot any unknown users out of the meeting.

And don't forget to pray for those who harassed you, Merritt said.

While his own group was too harried by the intrusion to do so together, he said, "it seems like the obvious, Christian thing to do in retrospect!"
