

Post-9/11 Stress Up

Thomas C. Fox | Aug. 5, 2009 NCR Today

The New York Post [had an article](#) [1] this morning describing the results of a Journal of the American Medical Association study showing a jump to 19 percent from 14 percent of people suffering from post traumatic stress now than immediately after the 9/11 attacks. In addition, the study concluded that "it turned out that there were significant correlations between soldiers "with high levels of horrific experiences" and those caught up in the chilling saga of 9/11."

What does all this mean?

"Following future disasters, we [the AMA] recommend short- and long-term interventions, including immediate outreach, screening and evidence-based treatments," the study concluded.
